8. Remarks

8.1 Input over voltage protection:

Driver goes into shutdown mode at 295+/-10v input voltage and above. Driver will survive higher mains input up to 48hrs at 320 vac, 2hrs 360vac & 30mins 380vac. It will not destroy both the unit and the load; shut down of load will occur in this condition.

8.2 Output short circuit protection:

Short circuit current is limited to approx. I_{av} 0.2 A without damage to the unit, for unlimited time. Be sure the load wire is designed to withstand the short circuit current as well.

8.3 Output overload protection:

The unit is intrinsically protected against over loading because the output voltage is limited.

8.4 Output over voltage protection:

As v_{out} increases from 54v the output current may decrease & shut down of load happens if v_{out} exceeds 57v; mains switchover is not needed to restart the unit.

8.5 Output under voltage operation:

The unit is not damaged if the load voltage is lower than 27v, but the load current increases up to the short circuit value. The load will go into hic-up mode for unlimited time. please make sure to replace with suitable load.

8.6 No load operation:

the unit is not damaged in this condition; the output wattage is lower than 3w and output voltage is limited to uout 60v. Mains switchover is not needed to restart the unit after load connection if mains is already on.

8.7 Over temperature operation:

It is not recommended to operate the device above Tc temperature limit. If tc exceed 120。 C approx. the unit will go into Hic-up mode; The protection is automatically reversible when temperature comes down.

8.8 Output power hold time:

< 1s, in case of mains dips.

8.9 HoT Plug:

Connection of LED on output is allowed without damage of LED.
